Michael Moreno

moreno.m2698@gmail.com | Hillsboro, OR | linkedin.com/in/michael-moreno-dev | github.com/moreno-m2698

PROFESSIONAL SUMMARY

Full stack software developer experienced in delivering production software for clients in fast-paced agency environments. Additional experience in project scoping, time estimation, and acceptance-criteria writing. Excellent team, stakeholder, and client-facing communication skills enable open discussion followed by action and delivery of commitments. B.S. in Mathematics and a minor in Chemistry.

EXPERIENCE

Full Stack Engineer | *By The Pixel, LLC* - Remote 2025 – 2026

Worked within a cross-functional development team at a web solution agency of ~30 people to provide clients with digital designs, cloud infrastructure, and web solutions in an Agile environment. Role eliminated in May 2026 as part of a company-wide layoff.

- Defined shared interfaces for 12 related domain models, and built matching features across a Next.js front end, a NestJS API, and a Laravel admin service, keeping the JavaScript, TypeScript, and PHP code in sync.
- Enforced domain boundaries within a NestJS server, moving cross-domain logic into the domains that owned it, fixing orphaned data issues and removing duplicate functions with conflicting behavior.
- Eliminated circular dependencies across 6 NestJS modules and standardized how modules are declared, which fixed failing production builds.
- Conducted peer code reviews on pull requests, catching logic and type defects before being moved to production and provided feedback for best practices when working with NestJS applications.
- Cut First Contentful Paint (FCP) by ~90% and search queries to under 1 second by designing aggregation pipelines builders for MongoDB across 4 business domains.
- Performed code reviews across 4 repositories, merged pull requests (PRs), and verified features against their acceptance criteria on dev builds before release, catching code regressions and edge cases before they reached production.
- Enforced practices for web accessibility compliance (Web Content Accessibility Guidelines (WCAG) 2.1) using semantic HTML elements, CSS accessibility media queries, and page landmarking. Defined accessibility attributes for web pages.
- Created components for a reusable and accessible internal design library. The library optimized development workflows across multiple high-visibility products, improving SEO (search engine optimization) ranking and Lighthouse scores while reducing frontend development costs.
- Played an active role in weekly check-ins with 3 client stakeholders to reprioritize features under tight budgets and deadlines, helping secure a 2 month contract renewal.

Web Developer | *BSA Troop 227* - Franklin, IN 2024

- Delivered a brochure website: Designed the UI and developed CI/CD (continuous integration/continuous deployment) pipeline through launch and support. Used React and GitHub hosting services.
- Optimized site structure and content for SEO, achieving the top Google result for local troop searches and earning strong satisfaction from organizers and troop families.

EDUCATION

B.S. in Mathematics - Minor in Chemistry | *University of Dayton* - Dayton, OH 2022

- Presented at Annual Stander Symposium about theoretical applications of the Fourier Transform.
- Volunteer for Cross-Cultural Communications Program supporting foreign exchange students.

Harvard CS50x Certification 2025

Self-Taught Full-Stack Development 2022 - 2024

- Developed coding, code organization, and Git practices by learning Python and its implementations of data structures and objects and developing applications using Flask.
- Used JavaScript/TypeScript with Express.js, Java, Spring Boot, and React to learn about design patterns, web communication, request handling, and UX/UI design in service of making web applications, APIs, and CRUD apps.
- Hosted applications with AWS services and Docker to learn about cloud platforms and CI/CD practices.
- Gained understanding of SQL, database normalization, and mapping libraries using PostgreSQL, mongoose ODM, and Prisma ORM.
- Completed Harvard's CS50x course to learn about memory management and lower-level code.

PROJECTS

Full Stack Match Analytics App | github.com/moreno-m2698/Fjords

This project provided experience creating CI/CD pipelines, managing cloud resources, architecting code with domain-driven design, and implementing media queries for responsive web designs.

- Created server application to use an N-tier architecture with Java and Spring Boot to organize business data, manage API rate limiting, and responsibly handle web requests.
- Architected data caching using Hibernate ORM with an H2 in-memory database to manage API rate limiting and enable error-free concurrent player lookup.
- Implemented a CI/CD pipeline using GitHub Actions and Docker to push regular updates without causing application downtime.
- Hosted using AWS tools (EC2, Route 53) to maintain application up time by decoupling it from any hardware constraints.
- Designed the web application in React to properly handle response data for individual players and display personalized analytics per match.

Technologies: Java, Spring Boot, React, TypeScript, Docker, AWS, GitHub Actions, Recharts, TanStack Query, JUnit, Hibernate ORM, H2

Discord Media Manager | github.com/moreno-m2698/WatchSama

This project provided experience working with browser development tools and extending libraries outside of their usual contexts to find creative solutions.

- Incorporated Selenium into bot commands to handle reading and updating auth-dependent user data, enabling users to update their account resources remotely from Discord.
- Collaborated with server admins to gather feature requirements and iterate based on feedback.

Technologies: Python, Selenium

Full Stack Music Web App | github.com/moreno-m2698/StudyCubbyExpress

This project provided experience working with reactive web frameworks, designing relational data within SQL databases, and creating apps using MVC architecture.

- Designed Node.js REST API using Express.js to handle web requests and manage file write/retrievals.
- Created web application using React to handle routing and return correct views.
- Deployed server-side application and database using AWS tools for app scalability to address concerns related to digital media storage.

Technologies: Express.js, Node.js, React, TypeScript, Prisma ORM, AWS (EC2, RDS), PostgreSQL, Netlify

SKILLS & DEVELOPMENT TECHNOLOGIES

Strongest:

Languages: JavaScript/TypeScript, Python, Java

Back End: REST APIs, Node.js, Object Oriented Programming (OOP), NestJS, Spring Boot
Front End: React, semantic HTML, CSS
Development Tools: Git

Workable:

Languages: PHP
Back End: SQL, PostgreSQL, Laravel, Prisma ORM
Front End: Next.js, WCAG 2.1 A, Vue.js
DevOps: AWS (EC2, S3, RDS, Route 53, Security Groups), GitHub Actions, Docker, CI/CD
Development Tools: Claude Code, GitHub Copilot, JetBrains IDEs, BeautifulSoup4

Familiar

Back End: Mongoose ODM, aggregate pipelines, MongoDB
Testing: JUnit, Pest, Selenium
